

Sanitized Meta Ads Analysis

A read-only marketing reporting harness for campaign analysis and decision support.

Property	Portfolio-safe value
Project type	AI-agent marketing reporting workflow
Data status	Anonymized / redacted
Safety mode	Read-only; no campaign changes
Output	Stakeholder-ready PDF analysis

This document demonstrates structure and method. Real client names, identifiers, creative text, exact account values, and raw API responses have been removed.

Executive summary

The harness retrieves advertising data, validates its currency and scope, compares delivery across campaign levels, and turns the findings into a practical report. It is designed to keep the agent useful without giving it permission to edit or publish campaigns.

The key design principle is simple: verify first, interpret second, recommend third.

What the workflow demonstrates

- Campaign-level totals are treated as the authoritative spend reference.
- Ad-set and ad-level data are retrieved separately for delivery comparison.
- Missing values are labelled unavailable instead of being silently converted to zero.
- Small samples are explicitly treated as directional evidence.
- Recommendations are separated from verified observations.

Harness workflow

Stage	Output	Control
1. Account validation	Currency and account state	No raw secrets in output
2. Campaign retrieval	Objective and status	Read-only scope
3. Campaign insights	Authoritative totals	Period explicitly recorded
4. Ad-set insights	Delivery structure	Cross-check hierarchy
5. Ad insights	Creative delivery comparison	Do not force reconciliation
6. Creative review	Copy, CTA, form, destination	Review live metadata
7. Report generation	Analysis PDF	Text and structure verified

Portfolio-safe analysis themes

- Identify the strongest early signal without declaring a winner too soon.
- Separate click performance from lead quality.
- Recommend better qualification, proof-led creative, and service-specific angles.
- Create a measurement plan that connects leads to meetings and revenue.

Example recommendations framework

The report output is designed to move beyond “CTR went up” and answer the business question: how do we generate more valuable opportunities?

Recommendation	Reason
Specific problem-led messaging	Helps prospects self-select by business need.
Separate service-led angles	Makes the offer easier to understand and test.
Qualification questions	Improves lead quality and reduces weak enquiries.
Proof-led creative	Adds credibility beyond generic agency language.
Clear next step	Sets expectations after form submission.
Qualified-lead measurement	Optimises for commercial value, not only platform volume.

What is intentionally excluded

- Access tokens, credentials, cookies, secrets, and private Hermes configuration.
- Client/account identifiers, raw exports, exact balances, and sensitive performance figures.
- Any campaign edit, publish action, budget change, or external account operation.

This sanitized sample is ready for public portfolio use and is not a substitute for the private working report.
